

## E-ACE Car DVR Mirror Camera System

While there are no perfect drivers, this Smart Camera system for cars performs several functions around the main objectives of ensuring safer driving, more precise parking and evidence a support should in case an accident arise. It is a great way to avoid being charged in cases of accidents that occur without any fault from you. The Smart camera trumps the commonly used dash-cams as they cover both fore and rear views as against the front view only that the dash-cams show.

In cases of accidents, the front view is definitely not going to get you off the hook alone and there is no better way to ensure you go free than to present evidence from both ends of the car. A camera is embedded into the detachable rear-view mirror and another camera (which is optional) is mounted at the rear of the vehicle. All the gathered details are projected on the 4.3-inch LCD screen that shows all the rear-view mirror recordings which also makes for perfect car parking.

An added advantage is the cool loop recording and G-sensor automatic save features that erases full memory and writes more recent footage while the G-sensor automatically locks and save videos incase an accident has occurred. You do not have to worry about performance in dark condition as the WDR and HDR Full HD 1080p recordings are exceptionally clear both in bright and low-light exposures.

The installation is simple! Simply plug into a power socket in your car and start recording.
